

The Activity log: who did what

What this is about

The **Activity** tab records everything that happens to your server: who started or stopped it, which files were edited, backups, schedule runs, and console commands. If something changed and you don't know why, look here first.

Column	Meaning
Actor	Who did it: you, a subuser , or System (the panel itself, e.g. a finished backup or a schedule)
Event	What happened (see below)
IP	Where the action came from
When	How long ago. Hover for the exact time.

Click the  button on a row for the full details.

Reading the event names

Events look like `server:power.action`. The common ones:

Event	Means
<code>server:power.action</code>	Start, stop, restart or kill
<code>server:console.command</code>	A command was typed into the console
<code>server:file.write</code>	A file was edited and saved
<code>server:file.read-content</code>	A file was opened
<code>server:file.delete</code> , <code>...rename</code> , <code>...copy</code>	Files deleted, renamed or copied
<code>server:file.compress</code> , <code>...decompress</code> , <code>...pull</code>	Archives made or extracted, files pulled from a URL
<code>server:backup.create</code> , <code>...restore</code> , <code>...complete</code>	Backups
<code>server:schedule.trigger</code>	A schedule ran
<code>server:subuser.create</code> , <code>...update</code> , <code>...delete</code>	Subusers changed
<code>server:startup.variables</code>	Startup settings changed
<code>server:settings.install</code>	The server was reinstalled
<code>server:settings.change-egg</code>	The game was switched with the Egg Changer

For edited files, a branch icon next to the event opens a **diff** showing exactly what changed.

Searching and filtering

- **Search** (top right) matches event names and usernames, e.g. `backup` or a subuser's name.
- Click a username in the **Actor** column to show only their actions. **Clear User Filter** shows everyone again.

Revision #3
