Your account activity and linked logins

What this is about

Two small pages in your account settings help you keep your panel account safe:

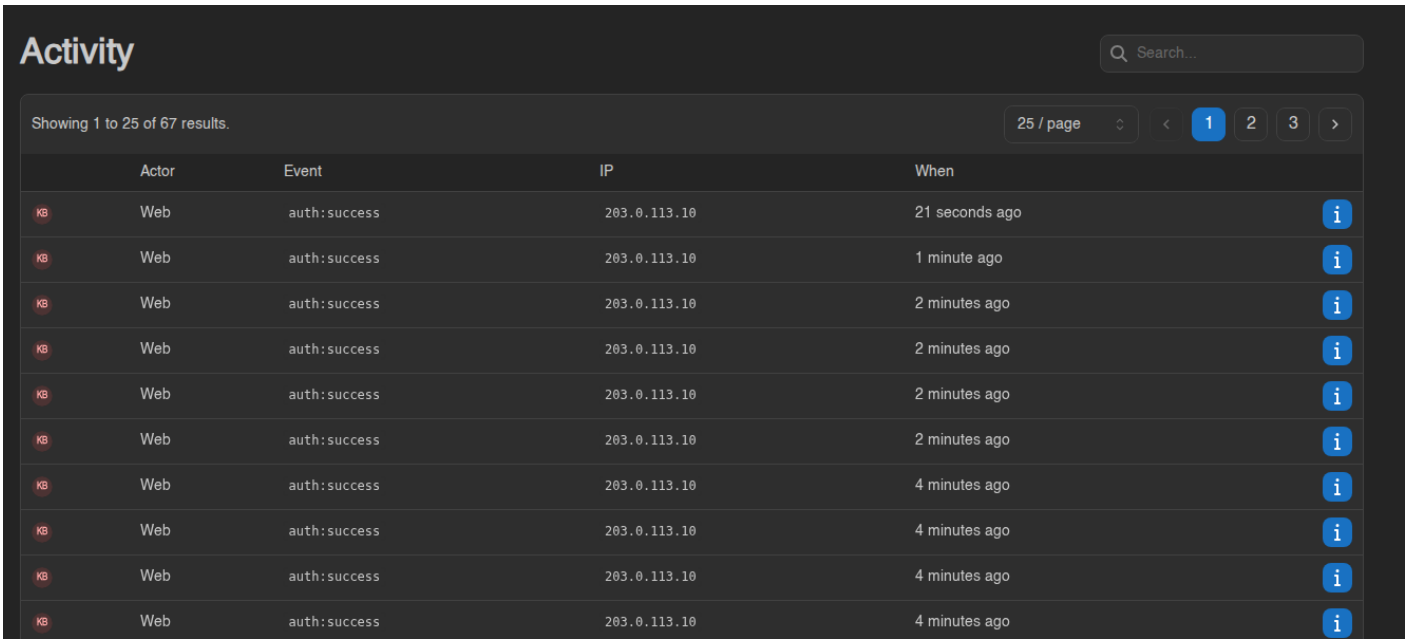

- **Activity** is a diary of everything done *with your account*: every login, password or email change, 2FA change, API key, SSH key and session you removed. If you ever wonder "did someone else log in as me?", this is where you look.
- **OAuth Links** shows which outside logins are connected to your panel account. At Something Unique Hosting that is the **Billing** link, which is what makes **Login with Billing** work.

> Things done *to your server* (starting it, editing files, backups, console commands) are not on this page. They are in the server's own Activity tab.

Finding the pages

1. Click your **name** in the bottom-left corner of the panel.
2. In the sidebar, click **Activity** or **OAuth Links**.

Your account activity

Newest events are at the top.

Column	Meaning
Actor	How it was done: **Web** (a browser) or **API** (an API key). If a member of our staff did something on your account while helping you with a ticket, it says *Impersonated by …* with their name.
Event	What happened (see the list below)
IP	The internet address it came from
When	How long ago. Hover for the exact time.

Click the button on a row to see the details, for example which browser was used.

What the events mean

Event	Means
`auth:success`	You signed in. The details show how: `password`, `oauth2` (Login with Billing), a passkey or security key, a 2FA code or a recovery code.
`auth:checkpoint`	Your password was accepted and the panel is waiting for your two-factor code.
`auth:reset-password`	A new password was set through **Forgot Password**.
`account:password-changed`	Your password was changed on the Account page.
`account:email-change-requested`, `account:email-changed`	An email change was requested, then confirmed.
`account:update`, `account:update-avatar`, `account:delete-avatar`	Account details, preferences or avatar changed.
`account:two-factor.enable`, `account:two-factor.disable`	Two-factor authentication turned on or off (`…two-factor.email…` for email codes).
`security-key:create`, `security-key:delete`	A passkey or security key was added or removed.
`session:delete`, `session:delete-all`	You removed a logged-in device, or used **Log Out Others**.
`api-key:create`, `api-key:delete`, `api-key:recreate`	API keys made, removed or recreated.
`ssh-key:create`, `ssh-key:import`, `ssh-key:delete`	SSH keys for SFTP.
`user:command-snippet.create`, `…update`, `…delete`	Command snippets.
`account:oauth-links.create`, `oauth-link:delete`	A linked login was added or removed.

The **Search** box at the top matches event names. Type `auth` to see only logins, or `password` for everything to do with your password.

> The log only records logins that succeeded. Someone trying a wrong password does not show up here.

Spotting a login you don't recognise

Look at the `auth:success` rows. For each one ask: was that me?

- **IP**: your own address changes when you switch between home, phone and a VPN, so one unfamiliar address is not proof of anything. A login from a country you have never been to is.
- **When**: a login at 4 am while you were asleep is worth a closer look.

- **details**: the browser named there should be one you use. A login *using* `oauth2` means someone signed in through the billing site.

If you think it wasn't you:

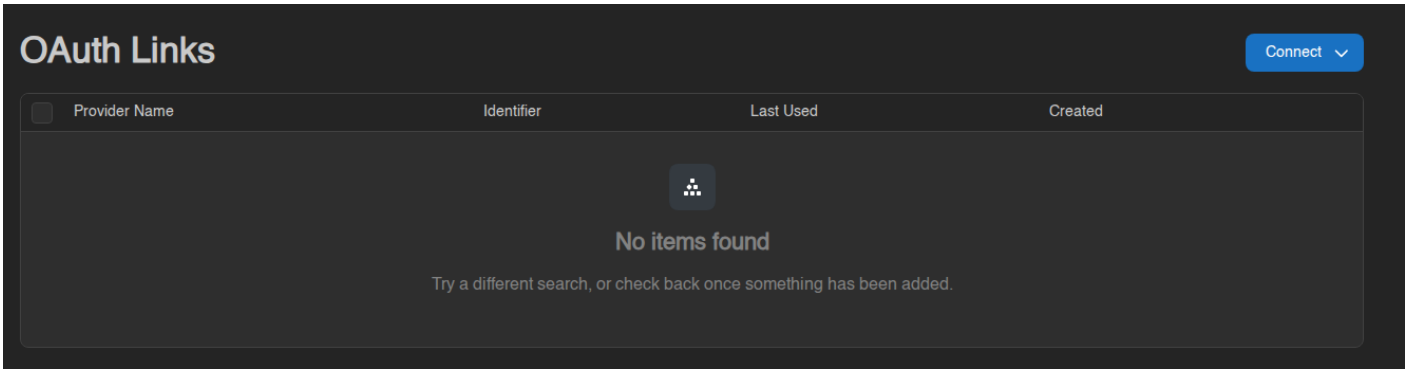

1. **Change your password** straight away on the Account page, and answer **Yes** when the panel offers to log out every other session.
2. Go to **Account → Sessions** and click **Log Out Others** if you haven't already. See Sessions, API keys and SSH keys.
3. Turn on **two-factor authentication**. See Two-factor authentication and security keys.
4. Check **Account → API Keys** and **SSH Keys** for anything you didn't create, and remove it.
5. Check the server's Activity tab to see whether anything was changed on your server.

> Anyone who can sign in to your **billing account** can also reach the panel with **Login with Billing**. If a login looks wrong, change your billing password too.

Still worried? Open a ticket on the billing site and tell us the time of the login you don't recognise.

OAuth links: logins connected to your account

An **OAuth link** connects your panel account to a login on another website, so that site can sign you in without a panel password. Your panel account is created by our billing site, and the **Billing** link is what the **Login with Billing** button on the login page uses.

This test account has no links yet. With a Billing link the table has one row.

Column	Meaning
Provider Name	The site you are linked to (**Billing**)

Column	Meaning
Identifier	Your account number on that site
Last Used	When you last signed in through it (**N/A** if you only use your password)
Created	When the link was made

> The Billing link is normal and you should leave it alone. It cannot be removed: **Remove** is greyed out for it, and the panel refuses the request. Your password and passkeys still work with or without it.

Connect only lists providers you are allowed to manage yourself. At the moment there are none, so the menu is empty. If your account has no Billing link and **Login with Billing** does not work, open a ticket and we will connect it for you.
